Notice of April 20, 1992 (1138 O.G. 37-41, 38).*

U.S. Patent No. 6,074,353, issued on June 13, 2000 to Helmer, describes a device for caressing the body. This device has strips of flexible soft material hanging from a horizontal support above the body. A motive source is used to move the horizontal support over the body so that the strips can contact the body with varying degrees of tactile sensitivity to caress, tickle, scratch, numb and create arousal sensations. The device is provided with an arm which is rotated in a circular pattern so that periodically, the strips of flexible material will contact the human body. The strips of flexible material do not travel a longitudinal path along the human body.

U.S. Patent No. 5,916,182, issued on June 29, 1999 to Fengler, teaches a massaging apparatus stored under a bed which is movable to a position over the bed. The massaging apparatus includes a mounting arm which can be moved from the space under the bed and pivoted to an upright position. When in the upright position, an elongated arm is connected to the mounting arm and pivotable in a direction toward and away from the bed. The elongated arm includes a massaging device mounted on its outer end. The massaging device is capable of being separately driven in a reciprocating manner. The elongated arm is appropriately counterbalanced so that the massaging device will apply a slight downward pressure onto the person who is being massaged.
